

Findings

The review covered every region and recorded the results below. Throughput was measured weekly at each site and aggregated by region before being compared against the targets agreed at the start of the period. Latency was sampled continuously and is reported separately. No site reported an outage lasting longer than four minutes, and the two brief interruptions recorded in the east were both planned. Staffing remained stable across the period with one vacancy filled. The following observations are drawn from the regional summaries.

- Eastern corridor exceeded its target by eleven percent this quarter
- Western corridor met its target with no reported incidents at all
- Northern corridor remains under review pending a site visit

1. Overview of the Quarter

Throughput rose across every region during the period under review.
